

Group 3 - Term Project Preliminary Design

Title: Flashcard Database

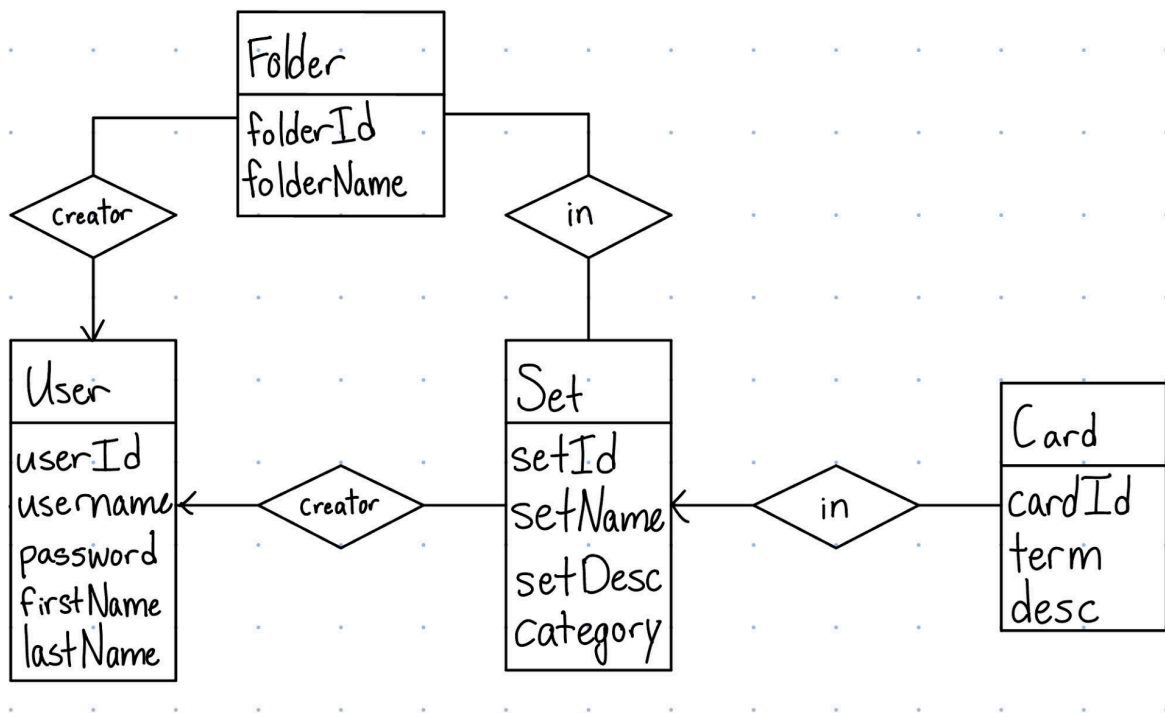

Description: This project aims to solve the problem of not having quick access to flashcards for certain subjects. Students end up using valuable time making a set of flashcards for a subject that was already studied by another person. The project falls within the education domain.

Solution: The website we will develop allows previous students to share their knowledge with new students by making their own flashcard sets which they and other users can study, improving test/quiz scores for all newer students. The website also lets its users create their own folders to hold sets in for organization and recall.

User Interfaces:

- Login
- Signup
- Profile
 - viewing the profile of the current user allows the logged in user to create and edit new folders and sets
 - viewing the profile of another user allows you to see the sets they have created
- Set Details
 - Shows the set information as well as all of the flashcards within the set.
- Folder Details
 - Shows the folder information as well as information of the sets contained within them.

Preliminary ER diagram:

Technologies To Use: VSCode, Springboot, Java, HTML, SQL Database, Docker Desktop
